

FCC,

GPS is the backbone of the surveying profession and is essential to the success of my new business. In the middle of a financial crisis, I stepped out of my comfort zone and invested my life savings in state of the art GPS equipment to run my new business. We must have the ability to use our precision GPS, or my business will fail due to the inability to pay off my \$100,000 investment in this GPS equipment.

I have attended workshops on the need for broadband especially in remote areas like northern Minnesota, but there has to be a better way to accomplish wireless broadband without destroying the lives of precision GPS users. If I was forced to double my hourly rates for surveying services in order to attempt to pay for useless equipment, I would destroy my business because the majority of my clients wouldn't be able to afford a survey.

The testing has scientifically proven that that GPS reception would be completely wiped out by LightSquared's proposed service. It can't be allowed. LightSquared should be ordered out of the GPS band completely. The American people can not afford it.

Sincerely, Kevin Lindow PLS
